

Facilities Issue Routing, Revision 1

NU-OPS-016 Document ID: NU-OPS-016 Status: superseded
Version: 1.0 Effective date: 2023-10-01 Access scope: site_operations
Site scope: all_sites

Northstar Urgent Care Cooperative (NUCC)
Status: Superseded historical copy · **Revision:** 1
Issue date: 25 September 2023 · **Effective period:** 1 October 2023–20 September 2024
Replacement: NU-OPS-003, effective 21 September 2024 · **Access scope:** site_operations

Fictional educational test material. This historical procedure describes non-clinical facilities routing only. It is not a current instruction and does not provide clinical, emergency-response, or patient-care guidance.

1. Purpose and applicability

This document preserves the earlier route for ordinary facilities and workspace issues at Harbor Point, Alder Creek, and Northgate. Its dates and process are invented for historical retrieval testing.

The scope was building and shared-workspace conditions such as a damaged fixture, lighting fault, leak, or facilities repair request. It did not determine clinical operations or establish how to respond to a clinical or emergency condition.

2. Prior issue categories

Under this prior process, site staff used two local labels:

Local label	Meaning
Follow-up	A repair or workspace request logged for the site lead's next routine review.
Needs site attention	A condition for which the site lead was notified during the current site handoff.

These labels are historical only. They do not map to the categories in NU-OPS-003 and must not be used to classify a current issue.

3. Former routing path

Under Revision 1, the staff member who noticed the issue entered it in the local site facilities log or gave the details to the site lead for entry. The site lead reviewed the log, recorded the local priority label, and assigned a local follow-up owner when one was available.

This route used the **site lead and local site log as the normal intake and tracking point**. It did not use a central Facilities Coordinator queue or require a routine central facilities ticket. For “Needs site attention,” the site lead was notified through the site’s ordinary handoff channel. No shared central mailbox, response time, or cross-site escalation route was established.

The site log entry contained the site, area, date observed, short description, local label, assigned role if known, and a brief status note. The site lead reviewed open entries at the next local handoff and marked the entry resolved when the site recorded a completed action or a documented transfer to another process.

4. Former escalation and follow-up

If the site lead could not identify a local owner, the item remained open in the site log and was raised at the next routine operations coordination meeting. This copy does not identify who attended that meeting, a meeting schedule, a central intake owner, or a guaranteed response.

If a condition also required another reporting route, the local log could note that a separate report had been made. This copy does not define that other process or authorize copying sensitive details into the facilities log.

5. Revision and replacement

Revision	Issue date	Effective dates	Record
1	2023-09-25	2023-10-01 through 2024-09-20	Local site-lead intake and site-log follow-up.

NU-OPS-003 replaced this routing path effective 21 September 2024. The historical period for this revision ended on 20 September 2024, and NU-OPS-016 became superseded when NU-OPS-003 took effect.

NU-OPS-016 is retained for historical questions about its effective period and must not be treated as current guidance.

6. Historical-use warning

Use this file only for a question about the Revision 1 route or for corpus precedence testing. Do not present its local site-lead intake path as the current route. The role-based contacts in NU-OPS-007 do not retroactively change this historical process.
